FridgeChef — Checkpoint 2 Task Plan

Nov 8, 2026 · @ColdBrew

For the video, everyone has to be on camera and show the work they did themselves (no text-to-speech).

A few parts depend on others, so here's the order: Enioluwa's recipes and Noire's test lists come first, then Seth's recommend function, then everything else plugs into that.

Enioluwa Olabode — Recipes

You're growing our recipe list and making it more balanced. Right now it has too many pasta and spinach dishes, and our professor called that out.

- [ ] Decide how many recipes we want in each category (breakfast, lunch, dinner, sides, appetizers, desserts)
- [ ] Add recipes until we have around 120 total, all from Food Network
- [ ] Add more variety: Mexican, Asian, Southern, vegetarian, and seafood dishes
- [ ] Keep pasta and spinach recipes from taking over the list
- [ ] Add two new columns to the spreadsheet: cuisine and main protein
- [ ] Double-check each recipe's ingredients against its Food Network page
- [ ] Delete any duplicates and fix formatting mistakes
- [ ] Share the finished file (recipes_v2.csv) with the team
- [ ] Make a simple chart showing recipes per category, before and after
- [ ] Record your video part: what you changed, why, and one problem you ran into

Mikayla Hollis — Ranking

You're making FridgeChef smarter at matching ingredients. Right now it misses obvious matches, like not realizing "fresh baby spinach leaves" is just spinach.

- [ ] Ignore extra words like fresh, chopped, minced, large, kosher, and baby when matching
- [ ] Fix the bug that turns "leaves" into "leave"
- [ ] Add more ingredient nicknames (like scallions = green onions)
- [ ] Make close matches count, so "spinach" matches "fresh baby spinach leaves"

- [ ] Assume everyone has basics like salt, pepper, oil, water, and butter, with a way to turn that off
- [ ] Add a new ranking method that scores recipes by how much of each one the user already has
- [ ] Only test your changes on Noire's 10 practice lists, not the hidden ones
- [ ] Save a before-and-after example using the same ingredients
- [ ] Record your video part: what you fixed, why the old method fell short, and your before-and-after example

Noire Meyers — Testing

You're checking whether FridgeChef actually gives good recommendations, using real tests and numbers.

- [ ] Write at least 3 normal ingredient lists, like what someone would really have in their fridge
- [ ] Write at least 3 lists from cuisines we don't have recipes for (like kimchi, tofu, and gochujang)
- [ ] Write at least 3 weird lists: one ingredient, a huge list of 25+, typos like "tomatos," and empty or random input
- [ ] Finish all 20 lists before Mikayla starts changing the ranking
- [ ] Split them into 10 practice lists and 10 hidden lists
- [ ] Give Mikayla only the practice lists, and share the hidden ones with Seth only
- [ ] Decide what counts as a "good" recipe result (for example, you'd only need 3 or fewer extra ingredients, not counting basics)
- [ ] Write a short script (evaluate.py) that scores the results
- [ ] Run all three ranking methods on the 10 hidden lists
- [ ] Go through the top 5 results for each list and mark which ones are good, with Seth doing the same
- [ ] Make one table comparing how the three methods did
- [ ] Record your video part: how you made the tests, why some are hidden, and which test confused the system most

Why keep some lists hidden? If Mikayla could see all 20, she could adjust the system to ace those exact lists, and our results would look better than they really are.

How many of the top 5 results are good picks (3 out of 5 good = 0.6). "Ingredient coverage" means how much of a recipe you already have (7 out of 10 ingredients = 70%).

Seth Williams — Backend

You're moving our recipes out of a spreadsheet into a small database and writing the one function that the app, the tests, and the command line all use, so they always give the same results.

- [ ] Plan the database tables (recipes, ingredients, and which recipe uses which ingredient)
- [ ] Load the new recipe file into a SQLite database
- [ ] Write a recommend function: you give it ingredients and a method, it gives back the top recipes
- [ ] Make the command-line version use your recommend function
- [ ] Share the function with Amarachi and Noire so they can use it
- [ ] Make bad input (empty, way too long, random text) show a clear message instead of crashing
- [ ] Help Noire mark which results are good during final testing
- [ ] Record your video part: why we switched to a database, plus a sample result from your function

Amarachi Abbah — Website/App

You're building a simple web page or app so people can actually use FridgeChef without the command line code.

- [ ] Pick a service for the webpage/app.
- [ ] Add a box to type ingredients, a menu to pick the ranking method, and an option for how many results to show
- [ ] Add an "I have the basics" checkbox
- [ ] Show each recipe as a card with the name, category, score, ingredients you have, ingredients you're missing, and the link
- [ ] Show a friendly message if someone types nothing or something the app doesn't understand
- [ ] Add a note saying results aren't allergy or nutrition advice

- [ ] Hook the page up to Seth's recommend function
- [ ] Record your video part: a live demo, one design choice you made, and what still needs work

Joshua Thomas — Team lead and video

You're putting everyone's work together, finishing the documentation, and running the video.

- [ ] Set up the shared GitHub repo so everyone has their own branch to work on
- [ ] Help if anyone needs it
- [ ] Combine everyone's work into one version that runs
- [ ] Check the pasta and spinach numbers again after our changes
- [ ] Update the README and the list of known limitations
- [ ] Complete documentation
- [ ] Write the video script and figure out timing for each person
- [ ] Collect everyone's recordings and do one full run-through
- [ ] Edit the final video to 10 minutes or less and make sure the link works
- [ ] Record your video parts: our progress, the bias results, what's still risky, and next steps
